

THE WEBSITE LAUNCH CHECKLIST

42 things to do before and right after you launch, so your website gets found, trusted, and turned into leads.

Prepared by Outlier Synapse

We build systems. You run the business.

Read This First

Many people build a website and then wait. No traffic comes. The reason is simple. A website that is built is not the same as a website that is found.

This guide gives you 42 items in 7 groups. Each item has what it is, why it matters, how to do it, and a quick check so you know it is done. Most are free and take 5 to 30 minutes.

Rule: Built is not found. Launch is the start, not the finish.

Start with these 11 first

If you have only one hour, do these. They give the biggest result for the least effort.

Priority	What to do	Item
1	Google Search Console	#1
2	Submit sitemap	#2
3	Google Analytics (GA4)	#6
4	Core Web Vitals with PageSpeed Insights	#9
5	Bing Webmaster Tools	#4
6	Page titles and meta descriptions	#13 and #14
7	robots.txt check	#3
8	Social share image (Open Graph)	#21
9	Google Business Profile	#5
10	Mobile friendly and HTTPS	#37 and #40
11	Internal links and image alt text	#17 and #16

Note: Search results take time. Google can take days or weeks to show a new site. Do the steps, then be patient and keep publishing.

Part 1: Get Found by Google and Bing

Building a site is step one. Making it discoverable is step two. These five items tell search engines your site exists and help people find it.

1. Set Up Google Search Console

What it is: Google Search Console is a free tool from Google. It shows if Google can find your site, which pages are saved in Google, and which searches bring people to you.

Why it matters: If Google does not know your site exists, nobody can find it by searching. Search Console is the front door to Google.

How to do it:

- Go to search.google.com/search-console and sign in with your Google account.
- Click Add property. Choose Domain if you own the domain, or URL prefix if you cannot edit DNS.
- Verify ownership. The Domain option uses a DNS record. The URL prefix option can use an HTML tag or file.
- After verifying, open URL Inspection, paste your homepage link, and click Request indexing.

Quick check: You see your site name at the top left of Search Console and the status says Verified.

2. Submit Your Sitemap

What it is: A sitemap is a file that lists all the pages on your site. It usually lives at yourdomain.com/sitemap.xml.

Why it matters: It is a map for Google. Without it Google may miss pages, especially new ones with no links pointing to them.

How to do it:

- Open your sitemap link in the browser first. If it shows a list of pages, it works.
- WordPress: Rank Math or Yoast creates it for you. Framer and Webflow create it automatically.
- Vibe coded site: tell your AI tool, Create a sitemap.xml with every public page and link it in robots.txt.
- In Search Console, open Sitemaps, type sitemap.xml, and click Submit.

Quick check: Status in the Sitemaps page says Success and shows the number of discovered pages.

3. Check Your robots.txt

What it is: robots.txt is a small file at yourdomain.com/robots.txt. It tells search engines which parts of your site they may visit.

Why it matters: One wrong line can hide your whole site from Google. This is a common mistake when a test site is copied to the live site.

How to do it:

- Open yourdomain.com/robots.txt in your browser.
- Make sure it does NOT contain Disallow: / for all bots. That line blocks everything.
- Add a line pointing to your sitemap, for example Sitemap: <https://yourdomain.com/sitemap.xml>.
- Block only private areas such as admin or cart pages, if needed.

Quick check: The file loads, has no full block, and shows your sitemap link.

4. Set Up Bing Webmaster Tools and IndexNow

What it is: Bing Webmaster Tools is the same idea as Search Console, but for Bing. IndexNow is a free protocol that tells Bing and some other engines the moment you publish or update a page.

Why it matters: Bing is smaller than Google but it still sends real visitors, and many competitors skip it. Setup is quick.

How to do it:

- Go to bing.com/webmasters and sign in.
- Use the Import from Google Search Console option. It copies your site and sitemap in a minute.
- For IndexNow, many tools (Rank Math, Cloudflare, Wix, Shopify apps) have a switch for it. Turn it on.
- Note: Google does not use IndexNow. Google still needs Search Console.

Quick check: Your site shows as verified in Bing Webmaster Tools and your sitemap is listed.

5. Create Your Google Business Profile

What it is: Google Business Profile is the free listing that appears on Google Maps and in local search results, with your reviews, phone number, and hours.

Why it matters: For local businesses (clinics, agents, gyms, shops) this is often the biggest source of calls and walk ins.

How to do it:

- Go to business.google.com and add your business.
- Use the exact same name, address, and phone number as on your website.
- Choose the right main category. It matters a lot for ranking.
- Add your website link, hours, services, and at least 10 real photos.
- Complete verification. It can take days or weeks, so start early.

Quick check: Search your business name on Google. A panel with your details appears on the right or top.

Part 2: Measure What Is Happening

If you cannot see visitors, you cannot improve anything. These three tools are free and show you who comes, what they do, and where they get stuck.

6. Install Google Analytics (GA4)

What it is: GA4 is Google's free analytics tool. It shows how many people visit, where they come from, and which pages they view.

Why it matters: It tells you if your content and ads actually bring people. Without it you are guessing.

How to do it:

- Go to analytics.google.com and create a property for your website.
- Create a Web data stream and copy the Measurement ID (it starts with G-).
- Paste it into your site. WordPress: use Site Kit by Google. Framer and Webflow: paste in site settings. Custom code: add the GA4 tag in the head.
- Open the Realtime report, visit your own site, and check that you see yourself.

Quick check: Realtime shows at least 1 active user when you open your site.

7. Track the Actions That Make Money

What it is: Page views are not the goal. Leads are. Events track actions like a form submit, a WhatsApp click, a call click, or a booking.

Why it matters: You learn which page or ad actually produces enquiries, so you can do more of what works.

How to do it:

- List your 3 key actions: form submit, WhatsApp click, phone click.
- Add an event for each one using Google Tag Manager or your builder's tracking option.
- In GA4, mark those events as key events.
- Running Meta ads? Also install the Meta Pixel and fire a Lead event on the thank you page.

Quick check: Do each action yourself and see the event appear in GA4 Realtime.

8. Add Microsoft Clarity

What it is: Clarity is a free tool that records visitor sessions and shows heatmaps of where people click and scroll.

Why it matters: You see exactly where people get confused or leave. That is worth more than any opinion.

How to do it:

- Go to clarity.microsoft.com and create a project.
- Copy the tracking code and paste it in your site head, or use the plugin for WordPress, Shopify, or Webflow.
- Wait a few days, then watch 10 recordings of mobile visitors.
- Look for rage clicks, ignored buttons, and pages people leave fast.

Quick check: The dashboard shows live sessions after you visit your own site.

Part 3: Speed and Core Web Vitals

Slow sites lose visitors and rank lower. Google measures speed and page stability using Core Web Vitals. Fix these four items.

9. Test and Fix Core Web Vitals

What it is: Core Web Vitals are three Google scores: LCP (how fast the main content shows), INP (how fast the page reacts to taps), and CLS (how much the layout jumps around).

Why it matters: Google uses them as a ranking signal, and slow pages make people leave. Good targets are LCP under 2.5 seconds, INP under 200 milliseconds, and CLS under 0.1.

How to do it:

- Go to pagespeed.web.dev and paste your page link.
- Check the Mobile tab first. Most visitors are on phones.
- Read the Opportunities list. Fix the biggest items first: large images, heavy scripts, missing image sizes.
- Test again after each fix. Test your homepage and your most important page.

Quick check: Mobile score is in the green zone (90 or more) or at least every Core Web Vital is marked Good.

10. Compress Your Images

What it is: Large photos are the number one reason sites are slow. Compression makes the file smaller without a visible quality loss.

Why it matters: A page with 5 big photos can take many seconds on mobile data. Small images load fast.

How to do it:

- Use Squoosh (squosh.app) or TinyPNG before you upload.
- Save images in WebP format when possible.
- Resize images to the size they are shown. A 4000 pixel photo in a 600 pixel box is wasted weight.
- WordPress: use ShortPixel or Smush to do this automatically.

Quick check: Most images are under 200 KB, and the hero image is under about 300 KB.

11. Lazy Load Images Below the Fold

What it is: Lazy loading means images further down the page load only when the visitor scrolls near them.

Why it matters: The top of your page appears faster because the browser does not load everything at once.

How to do it:

- Add loading="lazy" to images that are lower on the page. Most builders have this option.
- Do NOT lazy load your hero image at the top. It should load first.
- Always set width and height on images so the layout does not jump (this helps CLS).

Quick check: In PageSpeed, the warning about offscreen images disappears.

12. Limit Fonts and Third Party Scripts

What it is: Every font, chat widget, tracker, and popup adds weight. Third party scripts are code from other companies that load on your page.

Why it matters: Too many of them slow the site and hurt your Core Web Vitals.

How to do it:

- Use a maximum of 2 fonts and 2 or 3 font weights.
- List every script on your site. Remove any you do not use.
- Load chat and tracking tools after the main content when the tool allows it.
- Use Cloudflare free plan as a CDN to serve files faster.

Quick check: PageSpeed no longer flags Reduce the impact of third party code as a major issue.

Part 4: On Page SEO Basics

On page SEO means helping Google understand what each page is about. It is a checklist, not magic.

13. Write a Unique Page Title for Every Page

What it is: The page title is the blue clickable line in Google results. It is set in the title tag.

Why it matters: It is one of the strongest signals for what the page is about, and it decides if people click.

How to do it:

- Put the main keyword near the start. Add your brand at the end.
- Keep it about 50 to 60 characters so it does not get cut off.
- Make each page title different. Never leave the default Home or Untitled.
- Example: Dental Implants in Sydney | Bright Smile Clinic.

Quick check: Search site:yourdomain.com on Google and read the titles. Each should be different and clear.

14. Write a Meta Description for Every Page

What it is: The meta description is the short grey text under the title in Google results.

Why it matters: It does not directly raise rank, but a good one gets more clicks, which means more traffic.

How to do it:

- Write about 150 to 160 characters.
- Say what the page offers and add a reason to click, like Free quote or Book today.
- Use the main keyword naturally.
- Make each one unique.

Quick check: No page has an empty or copied description.

15. Use One H1 Heading Per Page

What it is: The H1 is the main heading on a page. H2 and H3 are smaller headings under it.

Why it matters: Headings give the page a clear structure for both people and search engines.

How to do it:

- Use exactly one H1 per page, and include the main topic or keyword.

- Use H2 for main sections and H3 for sub points.
- Do not pick headings just for size. Use them for meaning.

Quick check: Use a browser extension like Detailed SEO or check page source for h1. You find one.

16. Add Alt Text to Images

What it is: Alt text is a short description of an image written in the code. It is read aloud by screen readers and understood by Google.

Why it matters: It helps visually impaired visitors and helps your images appear in Google Images.

How to do it:

- Describe the image in a simple sentence, for example Dentist checking a patient in Hyderabad clinic.
- Add a keyword only where it fits naturally. Do not stuff keywords.
- Leave alt empty for purely decorative images.

Quick check: Every meaningful image has a short, clear description.

17. Add Internal Links Between Pages

What it is: Internal links are links from one page of your site to another.

Why it matters: They help Google discover pages, show which pages matter, and keep visitors moving toward a call to action.

How to do it:

- Link your home page to your main service pages.
- Link each service page to related pages and to the contact or booking page.
- Use clear link words like our dental implant service, not click here.
- Every important page should have at least 2 links pointing to it.

Quick check: No important page is an orphan (a page with no links to it).

18. Add Your City and Keyword to Service Pages

What it is: Local SEO means showing Google where you work and what you do on the page itself.

Why it matters: People search things like dentist near me or real estate agent Dubai. Pages with the place and service are more likely to match.

How to do it:

- Create one page per main service. Do not put every service on one page.
- Put the service and city in the title, H1, first paragraph, and URL.
- Add your address, phone number, and area served in the footer.
- Write real, useful content. Do not copy the same text for every city.

Quick check: Each service page clearly says what you do and where.

19. Add Local Business Schema

What it is: Schema is hidden code that tells Google facts about your business in a format it understands, like name, address, phone, hours, and ratings.

Why it matters: It helps Google show your business details correctly and can unlock richer search results.

How to do it:

- Use the LocalBusiness type (or a more specific one like Dentist).
- Include name, address, phone, opening hours, website, and logo.
- WordPress: Rank Math or Yoast can add it. Others: add JSON-LD code in the page head.
- Test it at search.google.com/test/rich-results.

Quick check: The Rich Results Test reads your schema without errors.

20. Add Breadcrumbs

What it is: Breadcrumbs are small links near the top of a page that show where you are, like Home > Services > Implants.

Why it matters: They help visitors navigate and help Google understand how your site is organised.

How to do it:

- Add breadcrumbs to pages that are two or more levels deep.
- Most WordPress SEO plugins and many builders have a breadcrumb option.
- Optional: add BreadcrumbList schema for search results.

Quick check: Each deeper page shows a clickable path back to the home page.

Part 5: Sharing, Trust and Proof

People decide in seconds if they trust you. These items make your site look real, safe, and shareable.

21. Add a Social Share Image (Open Graph Tags)

What it is: Open Graph tags control how your link looks when shared on WhatsApp, LinkedIn, Facebook, and X. They set the title, description, and image.

Why it matters: A good preview card gets far more clicks than a plain link. Many people share links on WhatsApp, so this matters.

How to do it:

- Add these tags in the page head: og:title, og:description, og:image, og:url.
- Use an image of 1200 x 630 pixels with your logo and a clear message.
- Each important page can have its own image.
- Test by pasting your link into WhatsApp or a tool like opengraph.xyz. Note that platforms cache old previews.

Quick check: Your link shows a proper title, description, and image when shared.

22. Add a Favicon

What it is: The favicon is the tiny icon that shows in the browser tab and in bookmarks.

Why it matters: A missing favicon makes a site look unfinished. Google also shows it next to your result on mobile.

How to do it:

- Make a square logo or letter icon (at least 48 x 48 pixels, ideally larger).
- Upload it in your site settings or add it with a link tag in the head.
- Also add an Apple touch icon so the logo looks right on phones.

Quick check: Your icon shows in the browser tab.

23. Show Real Reviews

What it is: Reviews are statements from real customers. They can be Google reviews, testimonials, or video clips.

Why it matters: Most buyers read reviews before they call. Proof beats claims.

How to do it:

- Collect reviews from real customers only. Never invent or buy them.
- Show 3 to 5 near your main call to action, with name and photo when allowed.
- Embed Google reviews using Trustindex or Elfsight.
- Ask every happy customer for a review after the job is done.

Quick check: Reviews are visible without scrolling far on your homepage.

24. Add Case Studies

What it is: A case study is a short story: the problem, what you did, and the result.

Why it matters: It shows you can deliver. It is proof for people who are not sure yet.

How to do it:

- Use this format: Problem, Solution, Result with a number.
- Add a photo or screenshot.
- End with a button to book a call.
- Start with 2 or 3. You do not need 10.

Quick check: A visitor can see at least one real result in under 30 seconds.

25. Add an FAQ Section

What it is: An FAQ answers the questions people ask before they buy, like price, time, and process.

Why it matters: It removes doubts, saves you repeat questions, and can bring search traffic.

How to do it:

- Write down the 5 questions customers ask most.
- Answer each in 2 or 3 simple sentences.
- Place the FAQ near the bottom of key pages, before the final call to action.
- Optional: add FAQ schema.

Quick check: Each top objection (price, time, trust) has an answer.

26. Add a Real Team Photo

What it is: A photo of the real owner or team, with names and roles.

Why it matters: People trust people. Stock photos look fake and weaken trust.

How to do it:

- Take a clear photo in good light. A phone is fine.
- Add a short line about each person.
- Put it on the About page and near contact details.

Quick check: A visitor can see who runs the business.

27. Add a Map and Directions

What it is: An embedded Google Map with your address and a Get Directions link.

Why it matters: It proves you are a real local business and saves visitors a step.

How to do it:

- Open your location on Google Maps, click Share, then Embed a map.
- Paste the code on your contact page.
- Add a Get Directions button that opens Google Maps.
- Match the address exactly with your Google Business Profile.

Quick check: The map loads and the address matches your listing.

28. Add a Privacy Policy Page

What it is: A page that explains what data you collect (forms, analytics, cookies) and how you use it.

Why it matters: It builds trust, and ad platforms and many laws expect it if you collect data. This is general guidance, not legal advice. Check rules for your country.

How to do it:

- Create a Privacy Policy page and link it in the footer.
- Add a link next to every form.
- If you use cookies or ads in regions that require consent, add a cookie banner (CookieYes is one option).
- Add terms and conditions if you sell services or products.

Quick check: The footer link works and every form points to the policy.

Part 6: Turn Visitors Into Leads

Traffic is useless if nobody takes action. These six items make it easy and safe for visitors to contact you.

29. Put a Clear Call to Action Above the Fold

What it is: Above the fold is the part of the page you see before scrolling. The call to action (CTA) is the button that asks for one next step.

Why it matters: If people cannot see what to do in 5 seconds, most leave.

How to do it:

- Write a headline that says what you do and who it is for.
- Add one main button, for example Book a free call or Get a quote.
- Use a color that stands out from the rest of the page.
- Use one main CTA per page, not five.

Quick check: Show the page to a stranger for 5 seconds. They can tell what you do and what to click.

30. Add a Sticky Mobile CTA

What it is: A button bar that stays at the bottom of the phone screen while the visitor scrolls, with Call or WhatsApp.

Why it matters: Most visitors are on mobile. The button is always one tap away.

How to do it:

- Add a bar with two buttons: Call and WhatsApp.
- Keep it slim so it does not cover the content.
- Use the tel: and wa.me links so the apps open directly.
- Show it on mobile only.

Quick check: On your phone, the bar stays visible while scrolling and both buttons work.

31. Create a Thank You Page

What it is: A page the visitor lands on after submitting a form.

Why it matters: It confirms the lead was received, tells them what happens next, and lets you track conversions properly.

How to do it:

- Create a simple page: Thanks, we will contact you within X hours.
- Redirect the form to it after submit.
- Fire your GA4 and Meta Pixel lead events on this page.
- Add a helpful next step, like a booking link.

Quick check: After a test form, you land on the thank you page and the event shows in GA4.

32. Add Success and Error Messages on Forms

What it is: Messages that tell the visitor if the form worked or what went wrong.

Why it matters: Without them people click submit again and again, or leave, not knowing if it worked.

How to do it:

- Show a clear success message after submit.
- Show a clear error next to the field that failed, like Please enter a valid phone number.
- Keep forms short: name, phone, and one question is often enough.
- Test with wrong data, empty fields, and a mobile keyboard.

Quick check: Every form gives clear feedback in all cases.

33. Promise a Response Time

What it is: A short line near the form, like We reply within 1 hour on business days.

Why it matters: It lowers the fear of being ignored and raises form submits. Make sure you keep the promise.

How to do it:

- Pick a time you can truly meet.
- Place the line right under the submit button.
- Set up an instant auto reply on WhatsApp or email to confirm you got the enquiry.

Quick check: The promise is visible near every form.

34. Make Phone, Email, and Logo Clickable

What it is: Phone numbers open the dialer, emails open the mail app, and the logo goes to the home page.

Why it matters: On a phone, a number that cannot be tapped is lost lead.

How to do it:

- Phone: use a tel: link, for example tel:+911234567890.
- Email: use a mailto: link.
- Logo: link it to the home page.
- Use a custom domain email like hello@yourbrand.com, not a free address.

Quick check: Tap every contact item on your phone. All of them work.

Part 7: Clean Up Before You Launch

Small errors make a site look unfinished. Do this cleanup pass last. It is also a good list to give your AI coding tool if you vibe coded the site.

35. Create a Custom 404 Page

What it is: The page shown when someone opens a link that does not exist.

Why it matters: A default error page loses the visitor. A helpful one brings them back.

How to do it:

- Write a friendly line, like This page is gone, but we can help.
- Add a search box, home button, and links to key pages.
- Make sure the page really returns a 404 status, not a normal page.

Quick check: Open [yourdomain.com/random-test](#) and see your custom page.

36. Find and Fix Broken Links and Buttons

What it is: Links that go nowhere and buttons that do nothing.

Why it matters: Broken links hurt trust and can hurt SEO. A dead button loses a lead.

How to do it:

- Click every menu item, button, and footer link.
- Use a free checker like Broken Link Checker or Screaming Frog (free for small sites).
- Fix or remove each broken item.
- Check that every CTA button goes to the right place.

Quick check: Link checker shows zero broken links.

37. Fix the Mobile Layout

What it is: How the site looks and behaves on phones: menu, text size, spacing, and overflow.

Why it matters: Google indexes the mobile version first. Most visitors use phones.

How to do it:

- Open the site on a real phone, not only the desktop preview.
- Remove horizontal scrolling. Nothing should stick out past the screen width.

- Add a working mobile menu (hamburger) and test it.
- Make buttons big enough to tap, at least about 44 pixels.
- Test every page on mobile, not just the home page.

Quick check: You can scroll every page with only an up and down thumb and nothing is cut off.

38. Remove Placeholder Text and Fix the Copyright Year

What it is: Leftover dummy text like Lorem ipsum, sample images, and an old copyright year.

Why it matters: Placeholder text screams unfinished. A wrong year looks abandoned.

How to do it:

- Search your site for lorem, sample, test, and your template name.
- Replace sample images with real ones.
- Set the footer to the current year, or use code that updates it automatically.
- Check every page title, meta text, and form label.

Quick check: No dummy text anywhere and the year is current.

39. Remove Unused Navigation and Fix Footer Links

What it is: Menu items and footer links that lead to empty or missing pages.

Why it matters: A short, clear menu helps people act. Dead links confuse them.

How to do it:

- Keep the main menu to 5 or 6 items.
- Remove pages you have not built.
- Footer: add services, contact details, privacy policy, and social links.
- Make sure each link opens the right page.

Quick check: Every menu and footer link works and is useful.

40. Force HTTPS and Choose One Web Address

What it is: HTTPS is the secure version of your site (the padlock). Your site should open with only one version: with or without www.

Why it matters: Browsers warn visitors on non secure sites. Two versions of the same site also split your SEO.

How to do it:

- Turn on SSL in your host. It is free on most platforms.
- Redirect http to https.
- Pick www or non www and redirect the other to it.
- Set the same version in Search Console and in your sitemap.

Quick check: Type `http://yourdomain.com` and you land on https with a padlock.

41. Set Up Backups and Basic Security

What it is: A saved copy of your site and simple protection against hackers.

Why it matters: If something breaks or is hacked, you restore in minutes instead of rebuilding.

How to do it:

- Turn on automatic backups (host option or UpdraftPlus for WordPress).
- Use a strong, unique password and turn on two step login.
- Keep themes and plugins updated and delete the ones you do not use.
- WordPress: add Wordfence or a similar security plugin.

Quick check: You can name where your latest backup is and how to restore it.

42. Do a Final Test on a Real Phone

What it is: A last pass as if you were a new visitor.

Why it matters: You will always find things you missed. Finding them yourself is better than a customer finding them.

How to do it:

- Open the site in an incognito window on your phone using mobile data.
- Read the home page as a stranger. Is the offer clear in 5 seconds?
- Submit every form and check the lead arrives.
- Tap every contact button.
- Run PageSpeed Insights one last time.

Quick check: A friend who has never seen the site can complete your main goal without help.

Full Launch Checklist

Print this page. Tick each item before you launch. If you do only one thing first, start with the 11 in the table at the start of this guide.

Part 1: Get Found by Google and Bing

- ☐ 1. Set Up Google Search Console
- ☐ 2. Submit Your Sitemap
- ☐ 3. Check Your robots.txt
- ☐ 4. Set Up Bing Webmaster Tools and IndexNow
- ☐ 5. Create Your Google Business Profile

Part 2: Measure What Is Happening

- ☐ 6. Install Google Analytics (GA4)
- ☐ 7. Track the Actions That Make Money
- ☐ 8. Add Microsoft Clarity

Part 3: Speed and Core Web Vitals

- ☐ 9. Test and Fix Core Web Vitals
- ☐ 10. Compress Your Images
- ☐ 11. Lazy Load Images Below the Fold
- ☐ 12. Limit Fonts and Third Party Scripts

Part 4: On Page SEO Basics

- ☐ 13. Write a Unique Page Title for Every Page
- ☐ 14. Write a Meta Description for Every Page
- ☐ 15. Use One H1 Heading Per Page
- ☐ 16. Add Alt Text to Images
- ☐ 17. Add Internal Links Between Pages
- ☐ 18. Add Your City and Keyword to Service Pages
- ☐ 19. Add Local Business Schema
- ☐ 20. Add Breadcrumbs

Part 5: Sharing, Trust and Proof

- [] 21. Add a Social Share Image (Open Graph Tags)
- [] 22. Add a Favicon
- [] 23. Show Real Reviews
- [] 24. Add Case Studies
- [] 25. Add an FAQ Section
- [] 26. Add a Real Team Photo
- [] 27. Add a Map and Directions
- [] 28. Add a Privacy Policy Page

Part 6: Turn Visitors Into Leads

- [] 29. Put a Clear Call to Action Above the Fold
- [] 30. Add a Sticky Mobile CTA
- [] 31. Create a Thank You Page
- [] 32. Add Success and Error Messages on Forms
- [] 33. Promise a Response Time
- [] 34. Make Phone, Email, and Logo Clickable

Part 7: Clean Up Before You Launch

- [] 35. Create a Custom 404 Page
- [] 36. Find and Fix Broken Links and Buttons
- [] 37. Fix the Mobile Layout
- [] 38. Remove Placeholder Text and Fix the Copyright Year
- [] 39. Remove Unused Navigation and Fix Footer Links
- [] 40. Force HTTPS and Choose One Web Address
- [] 41. Set Up Backups and Basic Security
- [] 42. Do a Final Test on a Real Phone

Want This Done For You, Not Just Explained?

You now have the full checklist. Many business owners know what to do but do not have the time, or the team, to do it.

Outlier Synapse builds Customer Acquisition Websites with all of this built in: search setup, tracking, speed, trust proof, and WhatsApp lead capture. We build systems. You run the business.

Book a free 30 minute call. We will look at your website and tell you exactly what to fix first.

Book your free 30 minute call
